

SFY-60S rapid halogen moisture meter

- 1.SFY-60S rapid halogen moisture meter is a new rapid water testing equipment that can be used to measure the moisture content of any substance,
(risk by heating the material except for a chemical reaction) of the pyrolysis apparatus using the principle of the design of the weight, measurement instruments sample weight at the same time, halogen heating elements and the rapid evaporation drying the sample channel.
In the drying process, apparatus, continuous measurement and real-time display of sample drying process the moisture content% loss, drying is complete, the final determination of the moisture content of locked display keys can be observed by the value of water, the weight of the initial value, start value, testing time data.
- 2.With the traditional method compared to oven heating, halogen heating can be achieved in the shortest time possible maximum heating power quickly at a high temperature sample was dry, greatly speeding up the measurement time. The instrument can be used for all the needs of rapid measurement of moisture in fields such as medicine, food, tobacco, chemicals, tea, food, textile, agriculture, forestry and so on.
- 3.The instrument of communication with the computer and test the water through the computer data print out the results.
- 4.Matching can also be used to test the printer directly to print out the results of water data.
